specify a namespace for the pages; instead the scaffolder will generate one based on the project name and the folder path: `CityBreaks.Pages.PropertyManager`. You want the unobtrusive validation scripts to be included, and you want to specify that your context uses SQLite. Putting all that together, your command is as follows:

```
dotnet aspnet-codegenerator razorpage -m Property
➥ -dc CityBreaksContext -outDir
➥ Pages\PropertyManager -udl -scripts -sqlite
```

This command must be executed within the folder that houses the project file. Once it has been completed, the pages appear in the specified folder shown in figure 8.11.

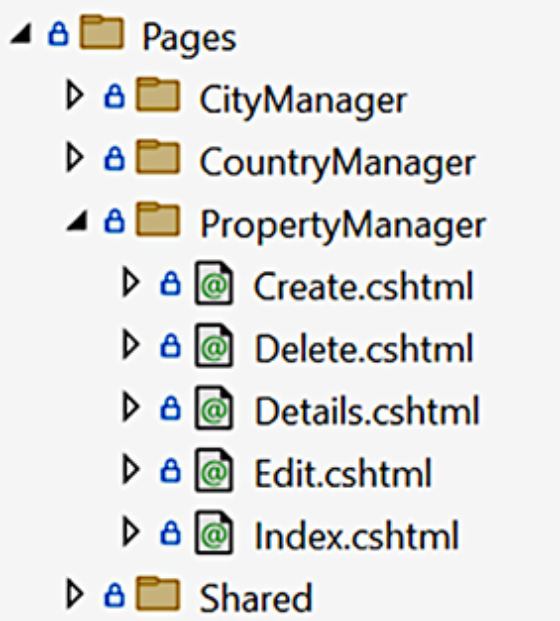

Figure 8.11 The scaffolded CRUD pages

8.4.3 Working with the scaffolded pages
