`DbUpdateConcurrencyException` if one is raised, which indicates the item you are editing no longer exists; someone else has deleted it between the time you retrieved it from the database and submitted your amendments. That is not a scenario you need to worry about because you won't be removing entries from the database. So your task is straightforward. You check `ModelState`, and if it is valid, you will pass the posted values as a `Property` instance to the service's `UpdateAsync` method.

Listing 8.30 The updated `OnPostAsync` method

```
public async Task<IActionResult> OnPostAsync()
{
    if (!ModelState.IsValid)
    {
        Cities = await GetCityOptions();
        return Page();
    }

    var property = new Property
    {
        Address = Address,
        AvailableFrom = AvailableFrom,
        CityId = CityId,
        DayRate = DayRate,Id = Id,
        MaxNumberOfGuests = MaxNumberOfGuests,
        Name = Name,
        SmokingPermitted = SmokingPermitted
    };
    await _propertyService.UpdateAsync(property);

    return RedirectToPage("./Index");
}
```

You've reached the final part of the transformation: the Razor page itself. There aren't many changes required here. All you need to do is

- Add a route template.
- Remove the `Property` prefix from the tag helper model expressions.
