- Update the source of city data in the cities select list.

You don’t want this page to be reachable unless a number is passed in the URL, so the route template must include a constraint. So you add the following template to the `@page` directive:

```
@page "{id:int}"
```

You have the `id` in the URL, and you have enabled binding to the route parameter in the `PageModel`, so you no longer need the hidden field in the form:

```
<input type="hidden" asp-for="Property.Id" />
```

You can comment it out or remove it altogether. Next locate the section of HTML for the cities select list, shown in the following listing.

**Listing 8.31 The scaffolded select list HTML**

```
<div class="form-group">
    <label asp-for="Property.CityId" class="control-label"></label>
    <select asp-for="Property.CityId" class="form-control"
     ➥ asp-items="ViewBag.CityId"></select>
    <span asp-validation-for="Property.CityId" class="text-danger"></span>
</div>
```

All of the references to `Property` should have red squiggly lines under them, indicating a compiler error. You need to remove them all, as well as those in other tag helpers in the page. You also need to update the `asp-items` attribute to reference `Model.Cities` instead of `ViewBag.CityId`. The modified version is shown in the following listing.

**Listing 8.32 The modified select list**
