amending the database schema accordingly. Both the Powershell and command-line options are shown in the following listing.

Listing 8.35 Add migrations

```
[Powershell]                                          ❶
add-migration AddedDeleteToProperty                   ❶
[CLI]                                                 ❷
dotnet ef migrations add AddedDeleteToProperty        ❷
```

❶ The Powershell command to be executed from within the Package Manager Console in Visual Studio

❷ The CLI command to be executed from a command prompt located within the directory containing the csproj file

Once executed, you can check the `Up` method in the migration code to ensure it will add a nullable `Delete` column. In SQLite, this will be a `TEXT` type.

Listing 8.36 The `Up` method of your new migration

```
protected override void Up(MigrationBuilder migrationBuilder)
{
    migrationBuilder.AddColumn<DateTime>(
        name: "Deleted",
        table: "Properties",
        type: "TEXT",
        nullable: true);
}
```

Now you can apply the migration using one of the following commands:

```
[Powershell]
update-database
[CLI]
dotnet ef database update
```

Once that has completed, add a new method to the `IPropertyService` interface:
