makes sense because, in real life, we actually have multiple forms of identity. I have a driver's license and a passport, for example. Both forms of identity share similar claims: my name and address. My driver's license also includes claims about the class of vehicle I am permitted to drive. I have a season ticket to go and watch my favorite football team. This is another form of identity with claims including the entrance I am permitted to use to access the stadium, the seat I am allocated, and the season for which the pass is valid. The concept is illustrated in figure 9.1.

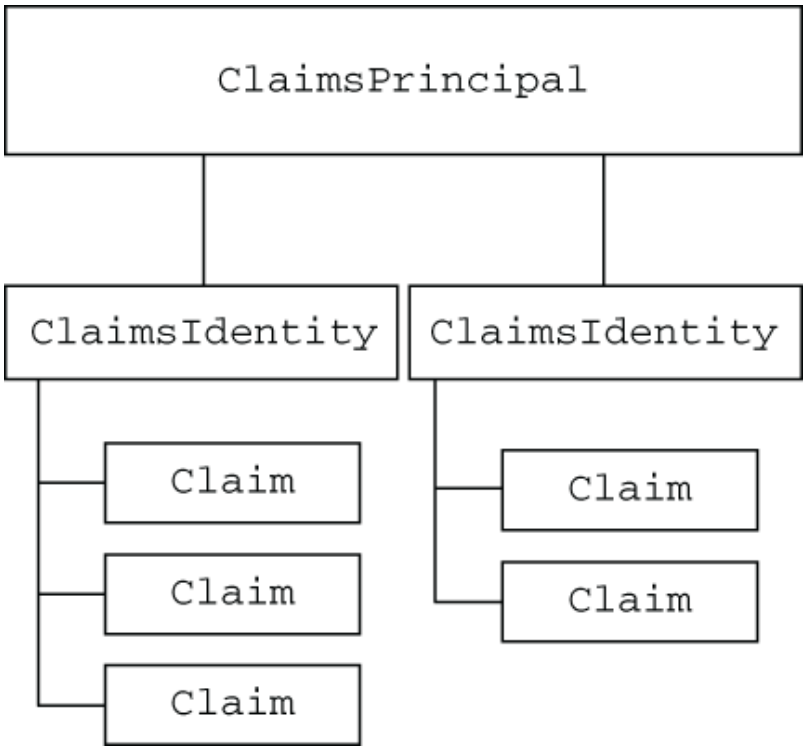

Figure 9.1 A `ClaimsPrincipal` supports multiple identities, each supporting multiple claims.

Once your principal has been created, you sign them in using the `SignInAsync` extension method on the `HttpContext`. This method uses the registered authentication handler to create a cookie, establishing that the user is authenticated.
