

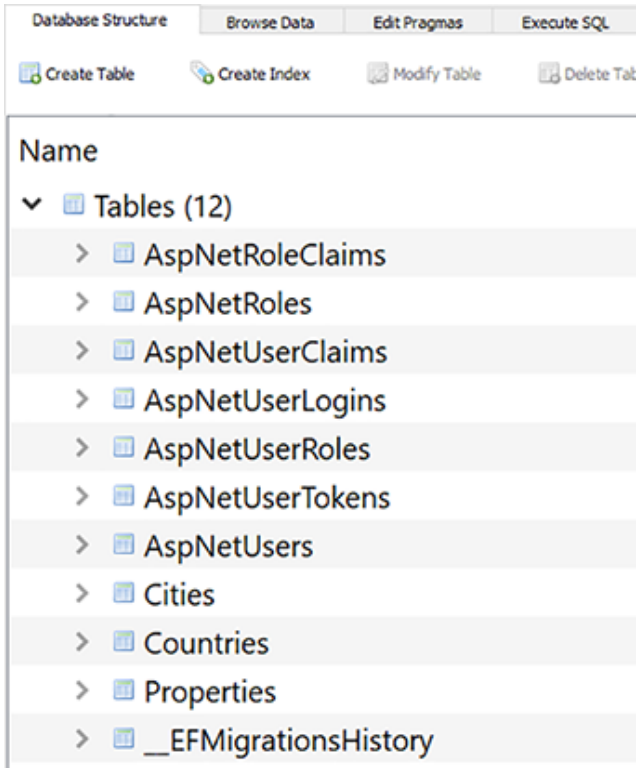

Figure 9.4 Identity adds seven tables prefixed with `AspNet`.

The primary table is the `AspNetUsers` table. This is where user profile data is stored. The other tables are optional. Three of them relate to the management of *roles*, which is a mechanism for managing different levels of authorization; we will explore these in the next chapter. The `AspNetUserClaims` table is for storing additional information about a user as a collection of claims to support authorization scenarios. The `AspNetUserLogins` table is for storing information about a user's external login, such as Google or Facebook, if you choose to implement third-party authentication. The `AspNetUserTokens` table is where external login authorization tokens are saved. I don't cover third-party authentication in this book, but you can refer to the official documentation for guidance on integrating with the most popular social login services: http://mng.bz/p6QK.

There is just one last thing you need to do before you can run the application. You need to replace the code you added to the layout in the previous section with a
