partial because the default Identity UI expects one name: _LoginPartial. So add a new Razor View > Empty to the Pages\Shared folder named _LoginPartial.cshtml. Cut the following section of code from the layout, and paste it into the new partial file. Add the `Sign out` anchor tag helper, and amend the `Sign in` anchor tag helper.

Listing 9.13 Extracting from the layout and pasting into _LoginPartial.cshtml

```
<div class="align-content-end">
    @if (User.Identity.IsAuthenticated)
    {
        <p>@User.Identity.Name, you are logged in
        <a asp-area="Identity" asp-page="/Account/Logout">Sign out</a>     ❶
        </p>
    }
    else
    {
        <a asp-area="Identity" asp-page="/Account/Login">Sign in</a>       ❷
    }
</div>
```

❶ Add an anchor tag helper for signing out.

❷ Change the anchor tag helper to specify the Identity area and Account/Login page.

At the point where you cut the code from the layout, replace it with

```
<partial name="_LoginPartial" />
```

Once this is done, you can launch the application. This time, the challenge in the `IndexModel OnGet` method should redirect you to Identity's default login path, /Identity/ Account/Login, illustrated in figure 9.5.
