

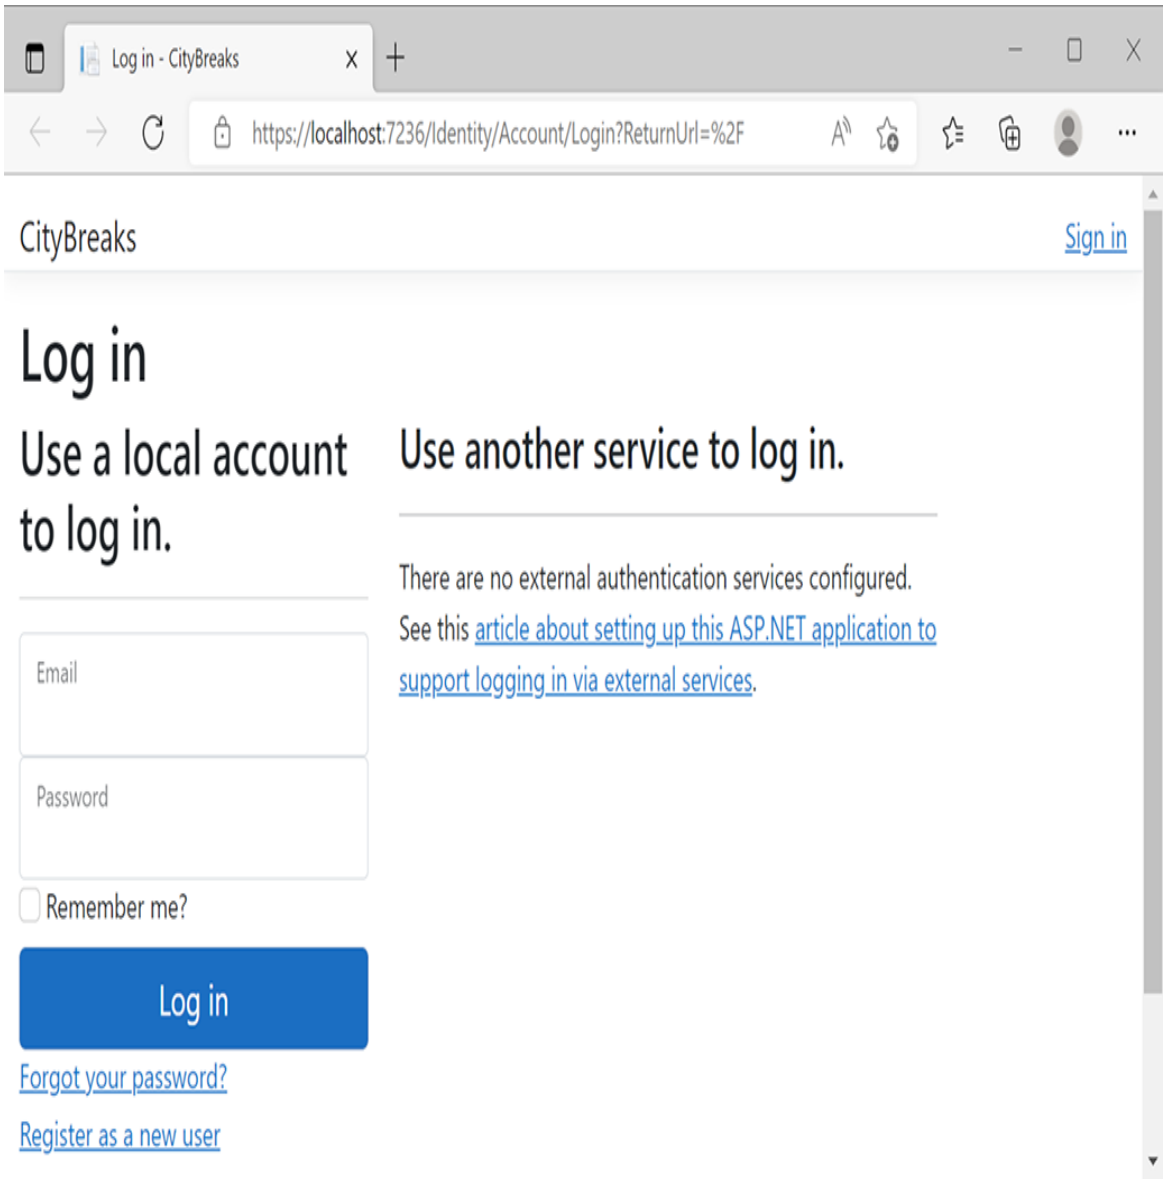

Figure 9.5 The default Identity login UI

If you were expecting an award-winning theme at this point, you are likely feeling a bit disappointed. The good news is that the default UI works; but it is not great to look at, and like the scaffolded CRUD pages you created in the previous chapter, it needs some customization before you can deploy it as part of a working application. Your users won't have much use for the content on the right, which links to an article about configuring external authentication providers, such as Facebook or Google.
