Table 9.1 Select `IdentityOptions` properties

Property	Type	Description
`User`	`UserOptions`	Provides access to the options for user validation
`Password`	`PasswordOptions`	Enables customization of your application's password policy
`SignIn`	`SignInOptions`	Represents configurable account confirmation options
`Lockout`	`LockoutOptions`	The options for managing your application's policy for locking accounts in the event of failed login attempts

Additional properties enable you to configure token generation for email confirmation, password reset, and so on, as well as a couple of options related to the storage of key values and personal data. You are unlikely to touch these for the majority of applications.

You will configure `IdentityOptions` via an overload of `AddDefaultIdentity <TUser>` that takes an `Action<IdentityOptions>` as an argument. The following listing illustrates this by showing how to configure specific options of the `User` and `Password` properties.

Listing 9.14 Setting Identity options

```
builder.Services.AddDefaultIdentity<CityBreaksUser>(options => {
    options.User.RequireUniqueEmail = false;          ❶
    options.Password.RequiredLength = 8;              ❷
})
```

❶ Set user options through the User property.

❷ Set password options though the Password property.

CONFIGURING USER OPTIONS
