Name	Default	Description
`AllowedForNewUsers`	`true`	Determines the value applied to the `LockoutEnabled` column for newly created users
`DefaultLockoutTimeSpan`	`5`	Sets the duration for the lockout (in minutes)
`MaxFailedAccessAttempts`	`5`	Specifies the maximum number of failed attempts to sign in before the account is locked out

The options in table 9.5 configure account lockout if it is used. You will see how this is managed later in the chapter when you customize the UI. Before that, we will look at customizing the user.

9.3.2 Customizing the user

Your user class, `CityBreaksUser`, derives from `IdentityUser`. As I have discussed, this has a limited number of properties relating to the user's profile. If you want to allow your user to book somewhere to stay, you need some additional information from them, such as their name and address, at the very least. Remember that the default data access technology behind Identity is EF Core, so rather than modifying the database schema manually to accommodate this data, you can add new properties to your user entity and then use a migration to propagate those changes to the database. First, you will modify the `CityBreaksUser` to include three properties.

Listing 9.16 Customizing the `IdentityUser`

```
public class CityBreaksUser : IdentityUser
{
    public string FirstName { get; set; }
    public string LastName {  get; set; }
    public string Address { get; set; }
}
```

Then, you will create a new migration:
