can use for reference. Once you scaffold a page, you take responsibility for managing its code.

If you are using VS Code, the scaffold dialog is not available to you. Instead, you can use the CLI to scaffold pages. First, you can list all the available files using the `-lf` or `--listFiles` option, as with the following command, executed from within the project folder:

```
dotnet aspnet-codegenerator identity --listFiles
```

Note that the `listFiles` options are case sensitive, and the tool name must include the hyphen: `aspnet-codegenerator`. When scaffolding CRUD pages, you may recall you did not need to include the hyphen. The output shows the filenames using dot notation in place of the path separator you see in the Visual Studio version of the file list (figure 9.11).
