

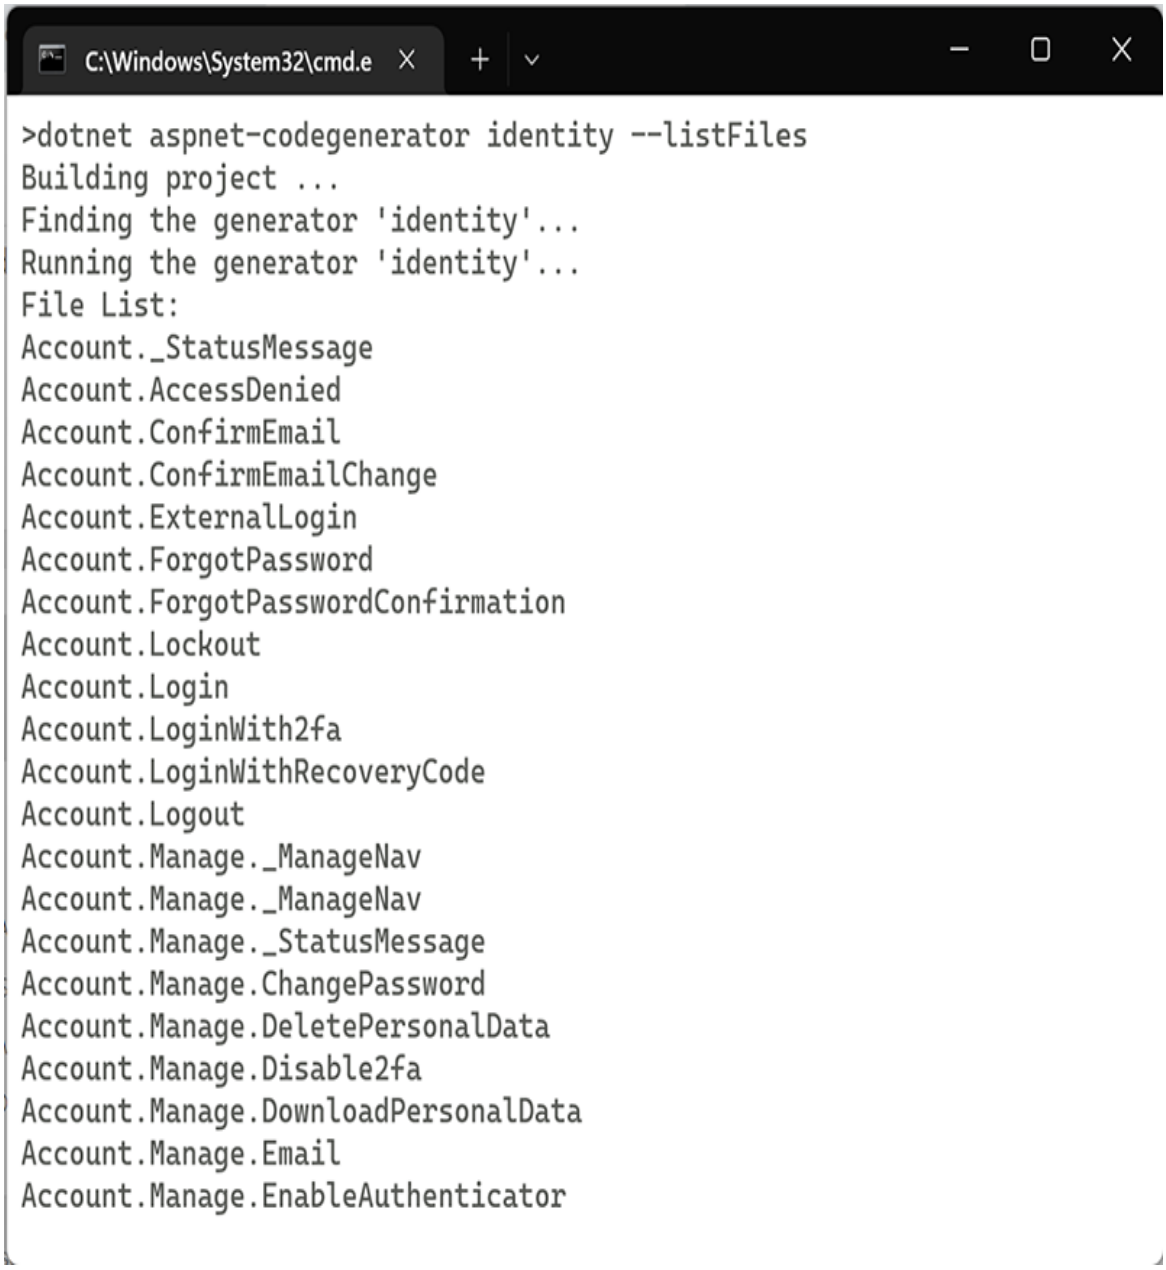

Figure 9.11 The Identity files listed using the CLI for scaffolding

Depending on the tool you use to scaffold, select the Account\Login and Account\Register files in the dialog, and select the `CityBreaksContext` as the data context class, or use the following command from the CLI:

```
dotnet aspnet-codegenerator identity -dc CityBreaks.Data.CityBreaksContext
➥ -sqlite -fi "Account.Login;Account.Register"
```
