```
            <div class="form-group">
                <input type="submit" value="Assign" class="btn btn-primary" />
            </div>
        </form>
    </div>
</div>

@section scripts{
<partial name="_ValidationScriptsPartial" />
}
```

Now run the application, and navigate to /roles-manager /create. Add a role named `Admin`, and once you are happy that works, add two more roles named `CityAdmin` and `PropertyAdmin`.

10.2.3 Assigning roles to users

Before you can assign roles to users, you need some users. Register three users in the application with the following email addresses and, for simplicity, the same password. I have used *password* in the code download that accompanies this chapter:

- anna@test.com
- colin@test.com
- paul@test.com

Next, add a new Razor page to the RolesManager folder named Assign. In this page, you will obtain a list of all users and a list of all roles and present them in select lists that will be used to assign the selected user to the selected role. Change the `AssignModel` code to the code in the following listing.

Listing 10.12 The `AssignModel` code

```
using CityBreaks.Models;
using Microsoft.AspNetCore.Identity;
using Microsoft.AspNetCore.Mvc;
using Microsoft.AspNetCore.Mvc.RazorPages;
```
