Listing 10.15 The `IndexModel` class for the claims manager section of the application

```
using CityBreaks.Models;
using Microsoft.AspNetCore.Identity;
using Microsoft.AspNetCore.Mvc.RazorPages;
using Microsoft.EntityFrameworkCore;

namespace CityBreaks.Pages.ClaimsManager
{
    public class IndexModel : PageModel
    {
        public UserManager<CityBreaksUser> UserManager { get; set; }
        public IndexModel(UserManager<CityBreaksUser> userManager)
        {
            UserManager = userManager;
        }
        public List<CityBreaksUser> Users { get; set; }
        public async Task OnGetAsync()
        {
            Users = await UserManager.Users.ToListAsync();
        }
    }
}
```

The Razor page iterates over the collection of users and obtains their claims via the `UserManager.GetClaimsAsync` method. This method communicates with the data store, so it only returns claims that have been stored in the database within the `AspNetUserClaims` table. The resulting data does not include the claims assigned by, for example, the authentication service. If any stored claims are found, details of them are rendered to the screen.

Listing 10.16 The `ClaimsManager` index page

```
@page
@model CityBreaks.Pages.ClaimsManager.IndexModel
@{
    ViewData["Title"] = "User Claims";
}
<h4>User Claims</h4>
<a class="btn btn-success" asp-page="/ClaimsManager/Assign">New</a>
@foreach (var user in Model.Users)
{
```
