You will use this page to create claims and assign them to users. The `UserManager` is injected into the `AssignModel` constructor and used to populate a `SelectList` containing the `Id` and `name` of each user. The selection will be bound to the `SelectedUserId` property. Two further bound properties are added, representing the claim type and value.

Listing 10.17 The `AssignModel` code for adding claims to users

```
