10.3.3 Using assertions for more complex requirements

The `RequireAssertion` method is provided to handle more complex requirements than the other methods can handle. For example, let's say you want to implement a requirement stating a user can access the roles management area if they have a claim with a particular value, but only if they have been with the business for more than six months. To be able to determine this, you will record the user's joining date as a claim. Then you need to convert the value to a `DateTime` and compare it to the current date to determine how long the user has been with the business.

To demonstrate this, examine the claims illustrated in figure 10.7. Note that, at the time of writing, Paul's joining date is less than six months ago, whereas the other users' joining dates are more than six months ago. If you want to replicate this exercise, it is important that you enter dates that meet the same criteria. Only Anna and Paul have a `Permission` claim with the value `View Roles`.
