

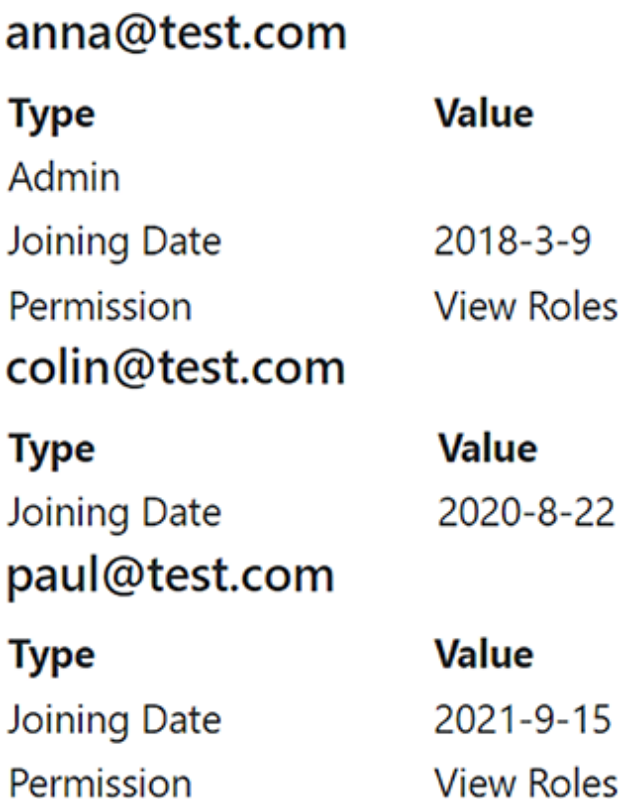

**Figure 10.7 The joining date and permission claims assigned to the users**

The `RequireAssertion` method takes an `AuthorizationHandlerContext` as a parameter, as shown in listing 10.18. This type provides you with access to the current user through its `User` property. From that, you can examine their claims. In the following code, you ensure the user has a claim named `Permission` and that its value is `View Roles`. Then you attempt to retrieve the value of a claim named `Joining Date` and convert it to a `DateTime`, so you can test its value based on your authorization requirement.

**Listing 10.18 `RequireAssertion` for more complex authorization requirements**

```
builder.Services.AddAuthorization(options =>
{
    options.AddPolicy("ViewRolesPolicy", policyBuilder =>
```
