DEFINITION A provider is a component that handles communication between your C# application code and the data store itself. One of the real benefits of an ORM like EF Core is that you don't need to write commands in data store-specific languages. You express your data commands in C#, which is data store-agnostic. Each individual provider is responsible for (among many other things) generating the domain-specific language (DSL) your chosen data store supports. In most cases, this DSL is SQL.
