```
<td>
    <a asp-page="./Details" asp-route-id="@item.Id">Details</a>
    @{
        var result = await authService.AuthorizeAsync(User,
        ➥ item, PropertyOperations.Edit);
        if (result.Succeeded)
        {
            @:|
            <a asp-page="./Edit" asp-route-id="@item.Id">Edit</a>
        }
        result = await authService.AuthorizeAsync(User,
        ➥ item, PropertyOperations.Delete);
        if (result.Succeeded)
        {
                @:|
                <a asp-page="./Delete" asp-route-id="@item.Id">Delete</a>
        }
    }
</td>
```

Here you are using the same method with the same parameters as you did with the `EditModel`'s `OnGetAsync` method. This time, if authorization evaluation succeeds, you render a link.

When Paul is logged in, he sees some Edit links but no Delete links at all because he is not in the `Admin` role. When Anna logs in, she is able to delete any property but only has an Edit link available for properties for which you assigned her as the creator (figure 10.9).
