

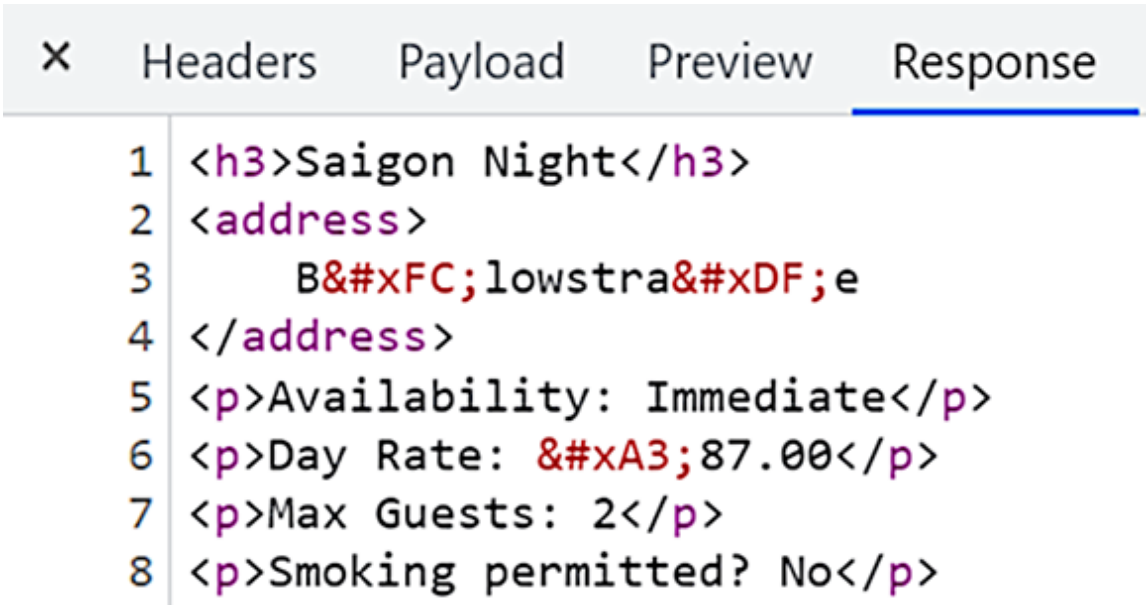

Figure 11.3 The raw response is captured in the Network tab.

So that's a simple `GET` request completed successfully. In the next exercise, you will attempt to post the content of a form to a page handler.

11.2.2 Posting to a page handler

Once you have the details of the selected property in the modal, it would be useful to select arrival and departure dates, specify the number of guests in your party, and obtain a total cost for a stay. In this section, you will add a form to the modal that enables you to do that and then post the content of the form to another handler method, which will return the total cost of the stay.

First, you need an input model to wrap a `Property` instance and the form values. Add the class declaration in the following listing to the `CityModel` class, so it is nested within it.

Listing 11.8 `BookingInputModel` added as a nested class to `CityModel`
