```
h5{
    cursor: pointer;
}
```

The reference to the stylesheet goes on the layout page. The filename you use in the reference is in the following format: `[name_of_application].styles.css`. The name of your application is CityBreaks, and you should already find the reference on the layout page. It was placed there as part of the project template:

```
<link href="~/CityBreaks.styles.css" rel="stylesheet" />
```

When you run the application and navigate to the City page, you can see that the cursor changes to a pointer when you hover over the names of the properties (figure 11.6). If you navigate to /claims-manager, you can see that the `h5` elements used to display the usernames are not affected by the same CSS rule, despite the fact that the stylesheet you just added is referenced globally in the layout file.

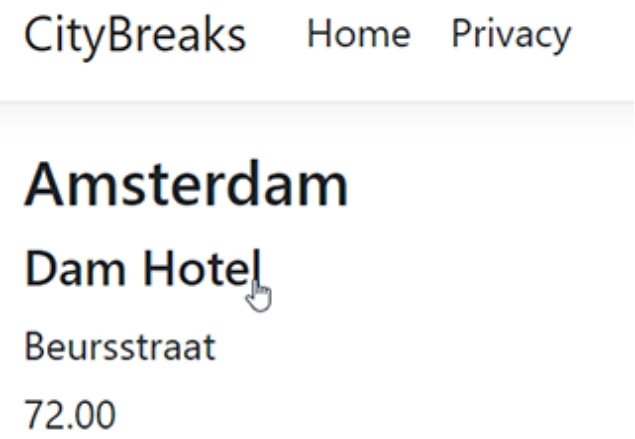

**Figure 11.6 The isolated CSS style declaration is applied to level-3 headings on this page only.**
