- Request handler parameter binding sources can be implicit or made explicit using the `From*` attribute, where the wildcard * represents the source—`Body`, `Services`, `Route`, and so on.
- Request handlers return `IResult`, strings, or other types serialized to JSON.
- Request handlers can partake in authorization via the `Authorize` attribute or the `RequireAuthorization` method.
- CSS isolation for Razor Pages is new in .NET 6.
- CSS isolation enables you to maintain styles scoped to a page in separate files for easier maintenance, without increasing the number of HTTP requests across your application.
- CSS isolation injects attributes into HTML elements at build time and uses them to scope CSS declarations to the page.
- Only one stylesheet is generated, which includes all scoped styles, reducing HTTP requests.
- Scoped styles only affect HTML elements, not tag helpers.
