The Developer Exception page is clever enough to work out where in the original source code the exception was raised and points to the offending line of code in City.cshtml, highlighting it in red (figure 12.2).

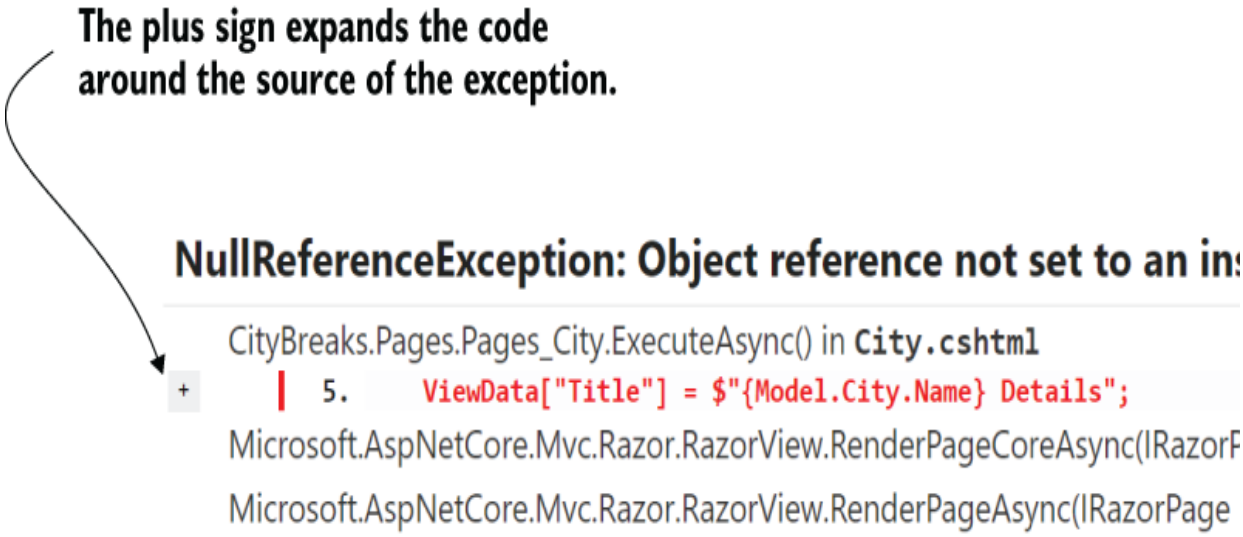

Figure 12.2 The original source code that generates the exception is indented, displayed in a red color, and has a plus sign to the left.

To make things clearer, you can click the plus sign to the left of the single line of code to show more code. From a developer's point of view, all this information is pure gold. You know exactly what broke, and you know which line or lines of code you need to focus on to fix it. If you are puzzled by the sometimes-obtuse error messages, you can always copy and paste them into a search engine. You'll probably find you are not alone in your puzzlement and that lots of developers before you have posted questions in technical communities about the same error and got good answers that can likely help you.

From a user's point of view, this is not gold at all. It doesn't help them one bit, unless the source code revealed by clicking the plus icon includes some interesting tidbits, such as a helpline phone number. Chances are that the source code is more likely to include some comments you don't want the
