404.cshtml. The content of the Razor page is shown in the following listing.

Listing 12.5 The content for the custom error page

```
@page
@model CityBreaks.Pages.Errors._404Model
@{
}
<h1>Sorry</h1>
<p>The page you are looking for doesn't exist on this site.
    Check the URL and try again. </p>
```

Next register StatusCodePages middleware with redirects in Program.cs. The format string passed into the registration method in listing 12.6 includes a placeholder for the status code. At run time, in the event of an error resulting in a 404 status code, the middleware will redirect to /errors/404 if it exists.

Listing 12.6 Registering StatusCodePages middleware with redirects

```
app.UseHttpsRedirection();
app.UseStatusCodePagesWithRedirects("/errors/{0}");     ❶
app.UseStaticFiles();
```

❶ The registration method takes a format string representing the HTTP status code.

Now run the application, and ensure you have the browser developer tools open in the Network tab. Then navigate to /city/mikebrind again. You should see the content of your 404 page displayed, and you should see that the request for `mikebrind` resulted in a 302 followed by a 200, as the error page was returned successfully to the browser (figure 12.6). One other thing to notice is that the URL in the browser address bar has also been changed to that of your custom error page (figure 12.7).
