unhandled exception in the `OnGetAsync` method of the home page's `IndexModel`.

Listing 12.16 Adding an unhandled exception to the application

```
public async Task OnGetAsync()
{
    Cities = await _cityService.GetAllAsync();
    throw new ApplicationException("Testing the logger");
}
```

Run the application, and you should find a new email has been generated in the TempMail folder you created in chapter 9. The email includes the state, the error message, and the stack trace, including the line of code where the error occurred (figure 12.12).

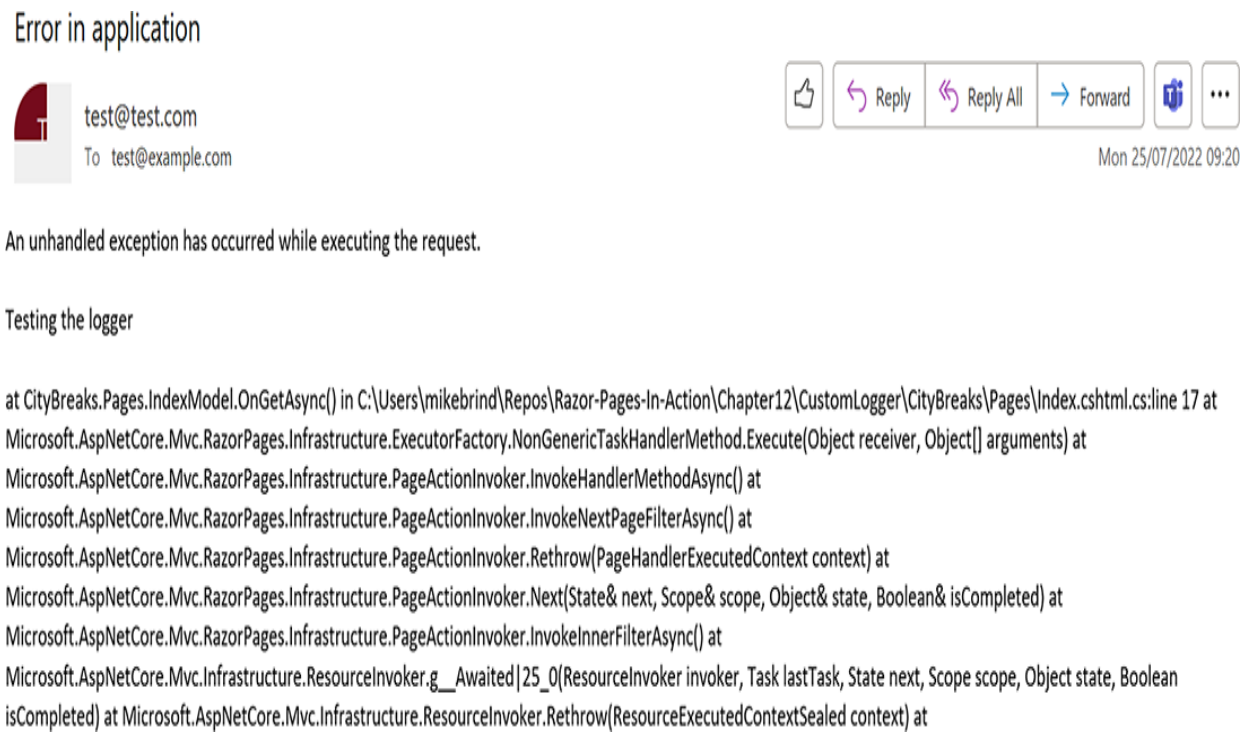

Figure 12.12 The email logger output

This example is designed to illustrate the basic steps required to implement your own custom logger. It is not an example of best practices and is
