```
        var filePath = Path.Combine(_environment.WebRootPath,
        ➥ "images", "cities", Photo);
        using var stream = System.IO.File.Create(filePath);
        await Upload.CopyToAsync(stream);
        return RedirectToPage("/CityManager/Index");
    }
    return Page();
}
```

❶ This is standard boilerplate code for configuring an AngleSharp BrowsingContext.

❷ Use the configured context to parse the incoming Description and assign it to an IDocument.

❸ Use the DOM QuerySelectorAll method to locate all script elements within the fragment, and if any exist, add an entry to the ModelState error collection.

Run the application, sign in, navigate to /city-manager /create, and enter `<script src="something"><script>` into the text area along with valid data for the name and image fields. When you submit the form, you should see the error message appear next to the text area.

That wraps up our look at securing your application against hostile acts. We have only covered the most common vulnerabilities in this chapter, which include how ASP.NET and other libraries, such as Identity and EF Core, protect against these common vulnerabilities as well as what you need to do to maintain security if you bypass the built-in protection offered by these frameworks. If you would like to learn more about web security as it relates specifically to ASP.NET Core development, I recommend *ASP.NET Core Security* by Christian Wenz (https://www.manning.com/books/asp-net-core-security).

In the final chapter, now that your application is secure, you will prepare the application for deployment and publish it as a live website.

Summary

- All public websites are subject to attacks, many of them automated.
- The Open Web Application Security Project maintains a list of the most common vulnerabilities.
- The first step toward protecting your website and its users is using HTTPS.
- HTTPS requires a certificate from a trusted certificate authority.
- Domain validation certificates validate who controls a domain. These are the most common certificates in use and can be obtained at no charge from some issuers.
