

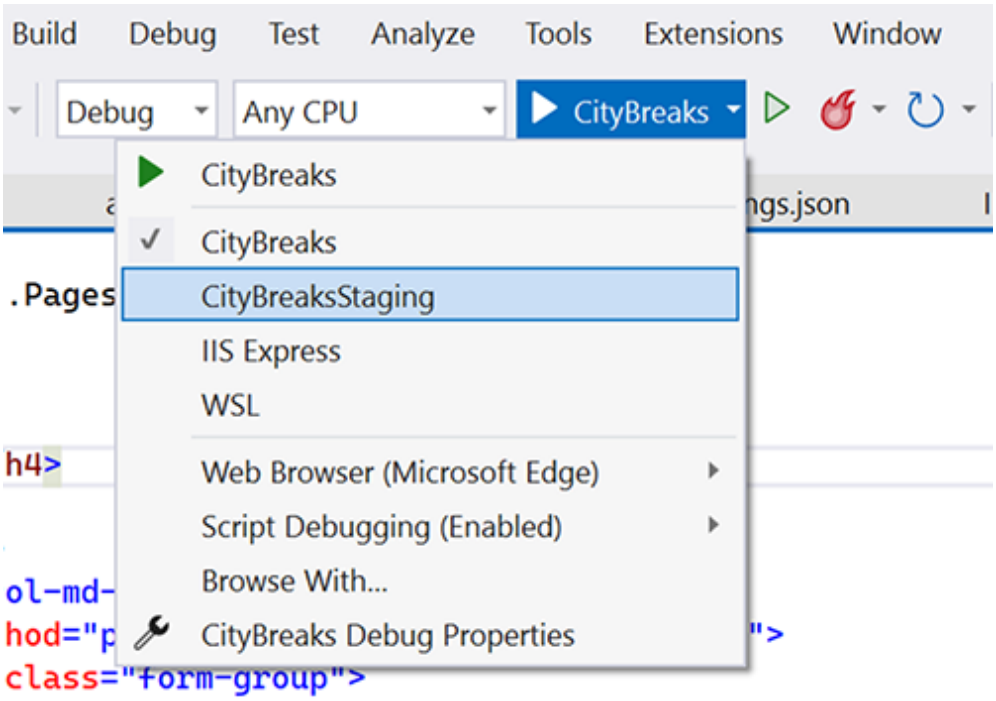

Figure 14.1 The new profile appears in the launch menu.

You can select the staging profile and press Ctrl-F5 or the green triangle to launch the application using the new profile. If you are using `dotnet run`, add a `--launch-profile` switch with the name of the new profile in quotes to the command:

```
dotnet run --launch-profile "CityBreaksStaging"
```

Either way, when you look at the log output from the application (replicated in the next listing), you can see the environment has been set to `Staging`.

Listing 14.3 Log output for CityBreaksStaging profile

```
[07:49:27 INF]
Starting up
[07:49:27 INF] Microsoft.Hosting.Lifetime
Now listening on: https://localhost:7237
[07:49:27 INF] Microsoft.Hosting.Lifetime
Now listening on: http://localhost:5237
[07:49:27 INF] Microsoft.Hosting.Lifetime
```
