```
Application started. Press Ctrl+C to shut down.
[07:49:27 INF] Microsoft.Hosting.Lifetime
Hosting environment: Staging                ❶
[07:49:27 INF] Microsoft.Hosting.Lifetime
Content root path: C:\Repos\CityBreaks\CityBreaks\
```

❶ Hosting is confirmed as staging.

As an alternative, you can also set the environment in code using the `WebApplicationOptions` object. This is passed to the `WebApplication.CreateBuilder` method in Program.cs. The following listing shows the environment being set to `Staging` using this approach.

Listing 14.4 Setting the environment via `WebApplicationOptions`

```
var builder = WebApplication.CreateBuilder(new WebApplicationOptions
{
    EnvironmentName = "Staging"
});
```

Now that you have set the environment, you can use it to conditionally add middleware and services. The default project template already includes an example of conditionally adding the `ExceptionHandler` and `Hsts` middleware when the `WebApplication`'s environment is not `Development`:

```
if (!app.Environment.IsDevelopment())
{
    app.UseExceptionHandler("/Error");
    app.UseHsts();
}
```

You will use the same approach to conditionally register services based on the `WebApplicationBuilder`'s environment.
