```
<PublishTrimmed>true</PublishTrimmed>
```

Your CityBreaks application loses more than 60 libraries when trimmed and about 40 MB in space. Examples of libraries that are trimmed out include `System.Globalization .Calendars` and `System.IO.Compression.Zipfile`. None of your code requires these dependencies.

The framework-dependent option includes only the application files and any external packages the application requires. This option depends on a compatible .NET runtime being available on the target machine. For most web application deployments, this is the option you are more likely to adopt. You are unlikely to obtain hosting services without having ensured the requisite runtime is installed on the target machine or that you have sufficient access to the hosting server to install it yourself.

14.4.2 Publishing using the CLI

Now we will move on to the actual publishing process. We'll take a look at using the `dotnet` CLI to produce the published output, starting with the main options available to the `publish` command shown in table 14.3.

Table 14.3 The main `publish` command options
