

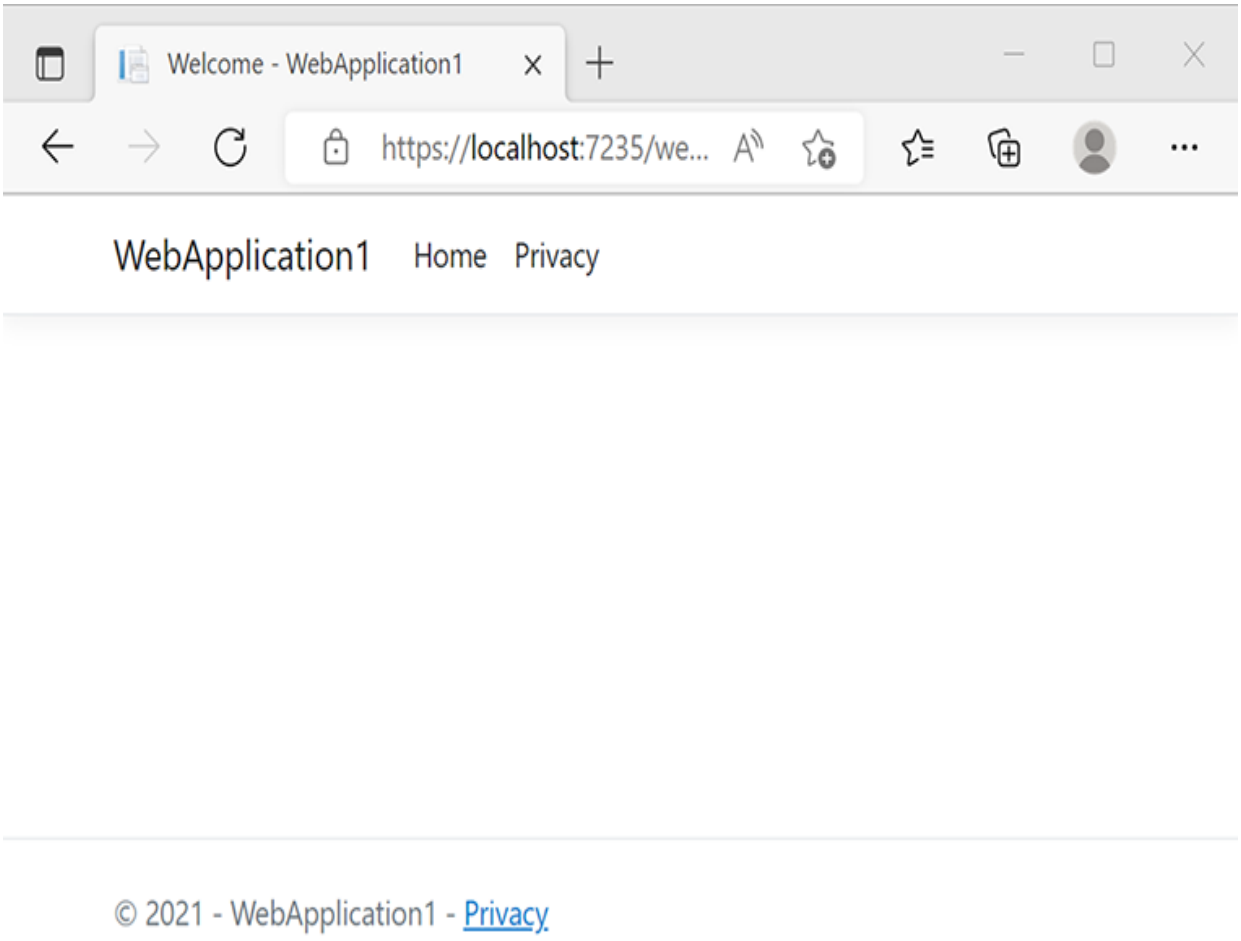

Figure 2.7 The new page is empty aside from the header and footer.

There are three interesting points to note here. The first is that you navigated to /welcome, and the Welcome page that you just added to the application was located and rendered. You didn't have to perform any configuration to get that to happen. The part of the ASP.NET Core framework responsible for this is called *routing*. It automatically locates Razor pages based on their location within the project. Routing is covered in detail in chapter 4.

The second point to note is that the new page includes the navigation, footer, and styles you saw in the home and privacy pages. Your page inherited these from a layout file, a kind of master template. Again, this happened without
