you having to take any specific steps to make it happen. You will learn about layout files and how to configure them in the next chapter.

The final item to note is the title of the page, as displayed in the browser tab: WebApplication1. The layout page also provides this value.

Now it's time to add some code to the page. Update the content of Welcome .cshtml, so it looks like the following.

Listing 2.3 Adding content to the Welcome page

```
@page
@model WebApplication1.Pages.WelcomeModel
@{
    ViewData["Title"] = "Welcome";
}
<h1>Welcome!</h1>
```

You don't even need to refresh the browser for the changes you applied to appear as soon as you save them. This is the hot reload feature working. You should see a level-one heading, and the title in the browser tab has changed to include the value that you applied to `ViewData["Title"]` (figure 2.8). `ViewData` is a mechanism for passing data from Razor pages to their layouts. You will see how `ViewData` works in the next chapter.
