to the build configuration used when the project is built. Initially, the bin and obj folders only include the Debug folder. The Release folder is not created until you build in Release mode. Unless you changed any configuration settings when you pressed Ctrl-F5 in the last section, your application has only been built in Debug mode at the moment.

The obj folder contains the artifacts used during the build process, and the bin folder contains the final output of the build. You will explore this output in more detail when you publish your application in chapter 14. If you delete either the bin or obj folder, they are recreated the next time you build your project.

Neither of these folders is visible in Solution Explorer by default. However, if you click the option to Show All Files, you can see them represented with a dotted outline. This indicator denotes that the folders are not considered part of the project itself. Once again, they are not hidden from VS Code users.

2.2.4 The Properties folder

The Properties folder contains project-specific resources and settings. The only item within the folder currently is a launchSettings.json file, which contains details of the settings to be used when you run your application.

The first group of settings is related to the IIS Express web server configuration for running your application locally. IIS Express is a lightweight version of the full IIS web server and is installed along with Visual Studio.

The second group of settings represents different launch profiles. The IIS Express profile specifies that the application should be run on IIS Express. Notice that the `applicationUrl` includes a port number. A different
