Property	Description
`Body`	A `Stream` containing the request body.
`ContentLength`	The value of the content-length header detailing the size of the request, measured in bytes.
`ContentType`	The value of the content-type header detailing the media type of the request.
`Cookies`	Provides access to the cookies collection.
`Form`	Represents submitted form data. You won't work with this directly. You are more likely to use model binding to access this data (see chapter 5).
`Headers`	Provides access to all request headers.
`IsHttps`	Indicates whether the current request was made over HTTPS.
`Method`	The HTTP verb used to make the request
`Path`	The part of the URL after the domain and port
`Query`	Provides access to query string values as key-value pairs

The `Response` property is represented by the `HttpResponse` class. Table 2.3 details the main members of this class and their purpose.

Table 2.3 Primary `HttpResponse` members
