TIP If you're using MS SQL Server (or LocalDB), you can use the SQL Server Object Explorer in Visual Studio to browse tables and objects in your database. See Microsoft's "How to: Connect to a Database and Browse Existing Objects" article for details: http://mng.bz/mg8r.

That's a lot of tables! You shouldn't need to interact with these tables directly (Identity handles that for you), but it doesn't hurt to have a basic grasp of what they're for:

- *__EFMigrationsHistory*—The standard EF Core migrations table that records which migrations have been applied.
- *AspNetUsers*—The user profile table itself. This is where `IdentityUser` is serialized to. We'll take a closer look at this table shortly.
- *AspNetUserClaims*—The claims associated with a given user. A user can have many claims, so it's modeled as a many-to-one relationship.
- *AspNetUserLogins and AspNetUserTokens*—These are related to third-party logins. When configured, these let users sign in with a Google or Facebook account (for example) instead of creating a password on your app.
- *AspNetUserRoles, AspNetRoles, and AspNetRoleClaims*—These tables let you define roles that multiple users can belong to. Each role can be assigned multiple claims. These claims are effectively inherited by a user principal when they are assigned that role.

You can explore these tables yourself, but the most interesting of them is the AspNetUsers table, shown in figure 23.8.
