

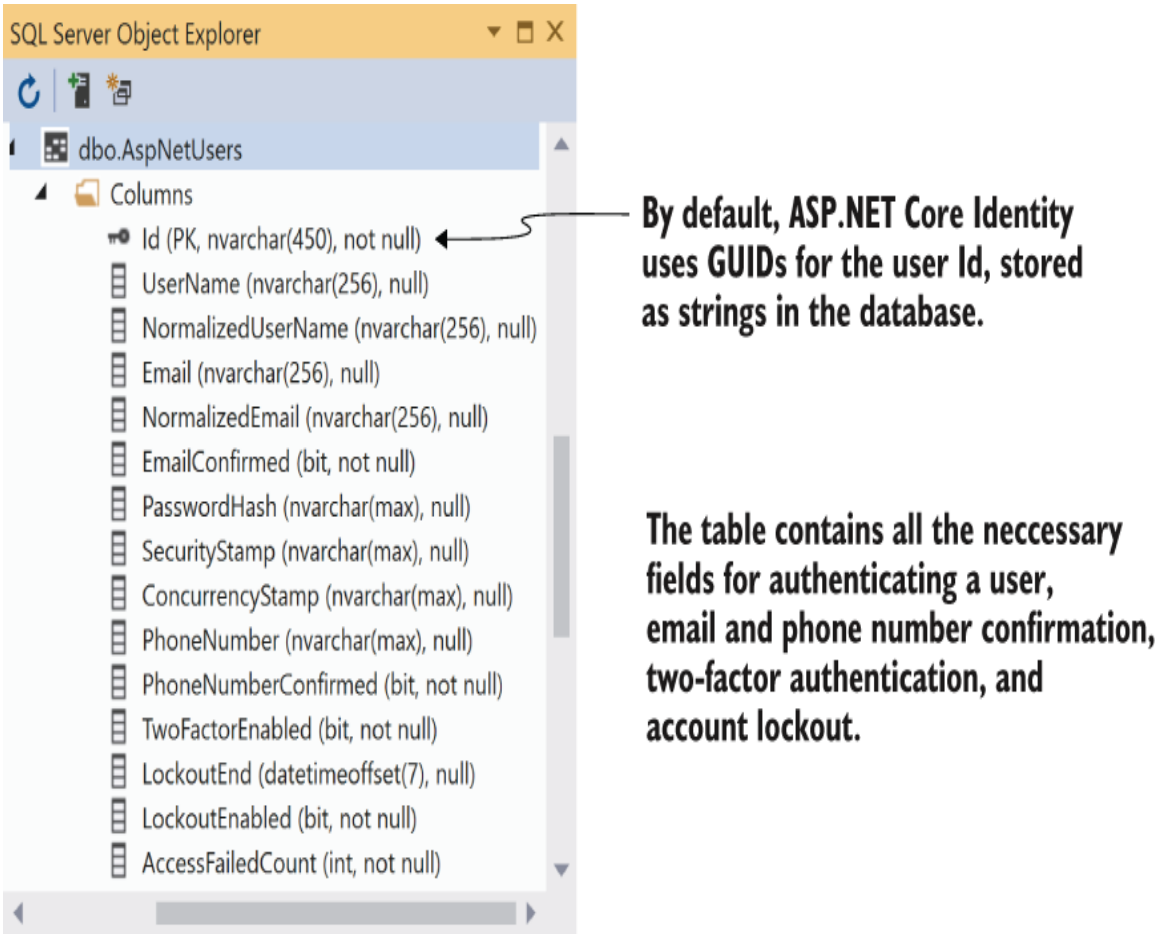

Figure 23.8 The AspNetUsers table is used to store all the details required to authenticate a user.

Most of the columns in the AspNetUsers table are security-related—the user's email, password hash, whether they have confirmed their email, whether they have MFA enabled, and so on. By default, there are no columns for additional information, like the user's name.

NOTE You can see from figure 23.8 that the primary key `Id` is stored as a `string` column. By default, Identity uses `Guid` for the identifier. To customize the data type, see the "Change the primary key type" section of Microsoft's "Identity model customization in ASP.NET Core" documentation: http://mng.bz/5jdB.
