By default, user emails must be unique (you can't have two users with the same email), and the password must meet various length and complexity requirements. You can customize these options and more in the configuration lambda of the call to `AddDefaultIdentity()` in Program.cs, as shown in the following listing.

Listing 23.2 Customizing Identity settings in `ConfigureServices` in Startup.cs

```
builder.Services.AddDefaultIdentity<IdentityUser>(options =>
{
    options.SignIn.RequireConfirmedAccount = true;      ❶
    options.Lockout.AllowedForNewUsers = true;          ❷
    options.Password.RequiredLength = 12;               ❸
    options.Password.RequireNonAlphanumeric = false;    ❸
    options.Password.RequireDigit = false;              ❸
})
.AddEntityFrameworkStores<AppDbContext>();
```

❶ Requires users to confirm their account by email before they can log in

❷ Enables user lockout, to prevent brute-force attacks against user passwords

❸ Updates password requirements. Current guidance is to require long passwords.

After a user has registered with your application, they need to log in, as shown in figure 23.10. On the right side of the login page, the default UI templates describe how you, the developer, can configure external login providers, such as Facebook and Google. This is useful information for you, but it's one of the reasons you may need to customize the default UI templates, as you'll see in section 23.5.
