3.3 Running the web application

You're ready to run your first application, and you have several ways to go about it. In Visual Studio, you can click the green arrow on the toolbar next to WebApplication1 or press the F5 shortcut. Visual Studio will automatically open a web browser window for you with the appropriate URL, and after a second or two, you should see the basic `"Hello World!"` response, as shown in figure 3.6.

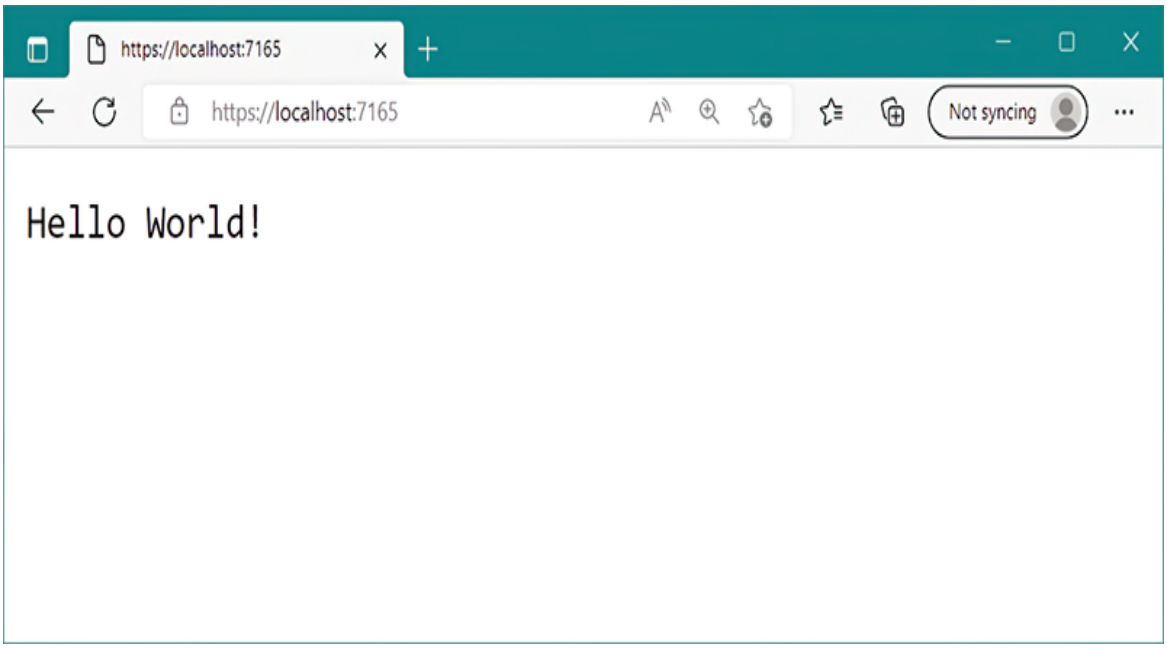

Figure 3.6 The output of your new ASP.NET Core application. The template chooses a random port to use for your application's URL, which will be opened in the browser automatically when you run from Visual Studio.

Alternatively, instead of using Visual Studio, you can run the application from the command line with the .NET CLI tools by using `dotnet run`. Then you can open the URL in a web browser manually, using the address provided on the command line. Depending on whether you created your application with Visual Studio, you may see an http:// or https:// URL.
