Having Identity provide the whole UI for your application is great in theory, but in practice there are a few wrinkles, as you saw in section 23.3.4. The default UI provides as much as it can, but there are some things you may want to tweak. For example, both the login and register pages describe how to configure external login providers for your ASP.NET Core applications, as you saw in figures 23.12 and 23.13. That's useful information for you as a developer, but it's not something you want to be showing to your users. Another often-cited requirement is the desire to change the look and feel of one or more pages.

Luckily, the default Identity UI is designed to be incrementally replaceable, so you can override a single page without having to rebuild the entire UI yourself. On top of that, both Visual Studio and the .NET CLI have functions that allow you to scaffold any (or all) of the pages in the default UI so that you don't have to start from scratch when you want to tweak a page.

DEFINITION *Scaffolding* is the process of generating files in your project that serve as the basis for customization. The Identity scaffolder adds Razor Pages in the correct locations so they override equivalent pages with the default UI. Initially, the code in the scaffolded pages matches that in the default Identity UI, but you are free to customize it.

As an example of the changes you can easily make, we'll scaffold the registration page and remove the additional information section about external providers. The following steps describe how to scaffold the Register.cshtml page in Visual Studio:
