have a specific claim. In both cases, you must meet one or more authorization requirements (for example, you must be authenticated) to execute the action.

If the user meets the authorization requirements, the request passes unimpeded through the `AuthorizationMiddleware`, and the endpoint is executed in the `EndpointMiddleware`. If they don't meet the requirements for the selected endpoint, the `AuthorizationMiddleware` will short-circuit the request. Depending on why the request failed authorization, the `AuthorizationMiddleware` generates one of two different types of responses, as shown in figure 24.3:

- *Challenge*—This response indicates that the user was not authorized to execute the action because they weren't yet logged in.
- *Forbid*—This response indicates that the user was logged in but didn't meet the requirements to execute the action. They didn't have a required claim, for example.
