- When running in the Development environment, details about each request are logged using the `HttpLoggingMiddleware`.[4]
- Creates a new endpoint at `/person` that creates an instance of the C# record called `Person` and serializes it in the response as JSON.

When you run the application and send requests via a web browser, you see details about the request displayed in the console, as shown in figure 3.8. If you call the `/person` endpoint you'll see the JSON representation of the `Person` record you created in the endpoint.

NOTE You can view the application only on the same computer that's running it at the moment; your application isn't exposed to the internet yet. You'll learn how to publish and deploy your application in chapter 27.
