may leak sensitive data. By filtering out the lower log levels, you can ensure that you generate a sane number of logs in production but have access to all the log levels in development.

In general, higher-level logs are more important than lower-level logs, so a `Warning` log is more important than an `Information` log, but there's another aspect to consider. Where the log came from, or who created the log, is a key piece of information that's recorded with each log message and is called the *category*.

26.2.2 Log category: Which component created the log?

As well as a log level, every log message also has a category. You set the log level independently for every log message, but the category is set when you create the `ILogger` instance. Like log levels, the category is particularly useful for filtering, as you'll see in section 26.4. It's written to every log message, as shown in figure 26.6.
