```
public class RecipeService
{
    private readonly ILogger _log;
    public RecipeService(ILoggerFactory factory)                    ❶
    {
        _log = factory.CreateLogger("RecipeApp.RecipeService");     ❷
    }
}
```

❶ Injects an ILoggerFactory instead of an ILogger directly

❷ Passes a category as a string when calling CreateLogger

There is also an overload of `CreateLogger()` with a generic parameter that uses the provided class to set the category. If the `RecipeService` in listing 26.4 were in the `RecipeApp` namespace, the `CreateLogger` call could be written equivalently as

```
_log = factory.CreateLogger<RecipeService>();
```

Similarly, the final `ILogger` instance created by this call would be the same as if you'd directly injected `ILogger<RecipeService>` instead of `ILoggerFactory`.

TIP Unless you're using heavily customized categories for some reason, favor injecting `ILogger<T>` into your methods over `ILoggerFactory`.

The final compulsory part of every log entry is fairly obvious: the *log message*. At the simplest level, this can be any string, but it's worth thinking carefully about what information would be useful to record—anything that will help you diagnose problems later on.
