3.1 A brief overview of an ASP.NET Core application

3.2 Creating your first ASP.NET Core application

Using a template to get started

Building the application

3.3 Running the web application

3.4 Understanding the project layout

3.5 The .csproj project file: Declaring your dependencies

3.6 Program.cs file: Defining your application

3.7 Adding functionality to your application

Adding and configuring services

Defining how requests are handled with middleware and endpoints

4 Handling requests with the middleware pipeline

4.1 Defining middleware

4.2 Combining middleware in a pipeline

Simple pipeline scenario 1: A holding page

Simple pipeline scenario 2: Handling static files

Simple pipeline scenario 3: A minimal API application

4.3 Handling errors using middleware

Viewing exceptions in development: DeveloperExceptionPage

Handling exceptions in production: ExceptionHandlerMiddleware

5 Creating a JSON API with minimal APIs

5.1 What is an HTTP API, and when should you use one?

5.2 Defining minimal API endpoints

Extracting values from the URL with routing

Mapping verbs to endpoints

Defining route handlers with functions

5.3 Generating responses with IResult

Returning status codes with Results and TypedResults

Returning useful errors with Problem Details
