is important: the order in which they're added to the builder is the order in which they'll execute in the final pipeline. Middleware can use only objects created by previous middleware in the pipeline; it can't access objects created by later middleware.

WARNING It's important to consider the order of middleware when adding it to the pipeline, as middleware can use only objects created earlier in the pipeline.

You should also note that listing 3.4 uses the `WebApplication.Environment` property (an instance of `IWebHostEnvironment`) to provide different behavior when you're in a development environment. The `HttpLoggingMiddleware` is added to the pipeline only when you're running in development; when you're running in production (or, rather, when `EnvironmentName` is *not* set to `"Development"`), the `HttpLoggingMiddleware` will not be added.

NOTE You'll learn about hosting environments and how to change the current environment in chapter 10.

The `WebApplicationBuilder` builds an `IWebHostEnvironment` object and sets it on the `Environment` property. `IWebHostEnvironment` exposes several environment-related properties, such as

- `ContentRootPath`—Location of the working directory for the app, typically the folder in which the application is running
- `WebRootPath`—Location of the wwwroot folder that contains static files
- `EnvironmentName`—Whether the current environment is a development or production environment
