By contrast, the origins of the following sites are different, so you couldn't request any of these URLs using JavaScript from the http://example.com origin:

- *https://example.com*—Different scheme (https)
- *http://www.example.com*—Different domain (includes a subdomain)
- *http://example.com:5000*—Different port (default HTTP port is 80)

For simple apps, where you have a single web app handling all your functionality, this limitation might not be a problem, but it's extremely common for an app to make requests to another domain. For example, you might have an e-commerce site hosted at http://shopping.com, and you're attempting to load data from http://api.shop ping.com to display details about the products available for sale. With this configuration, you'll fall foul of the same-origin policy. Any attempt to make a request using JavaScript to the API domain will fail, with an error similar to figure 29.6.

The browser won't allow cross-origin requests by default and will block your app from accessing the response.

Figure 29.6 The console log for a failed cross-origin request. Chrome has blocked a cross-origin request from the app http://shopping.com:6333 to the API at http://api.shopping.com:5111.
