❶ Adds the CORS middleware and uses AllowShoppingApp as the default policy

NOTE As with all middleware, the order of the CORS middleware is important. You must place the call to `UseCors()` *after* `UseRouting()`. The CORS middleware needs to intercept cross-origin requests to your web API actions so it can generate the correct responses to preflight requests and add the necessary headers. It's common to place the CORS middleware before a call to `UseAuthentication()`.

With the CORS middleware in place for the API, the shopping app can now make cross-origin requests. You can call the API from the http://shopping.com site, and the browser lets the CORS request through, as shown in figure 29.8. If you make the same request from a domain other than http://shopping.com, the request continues to be blocked.
