

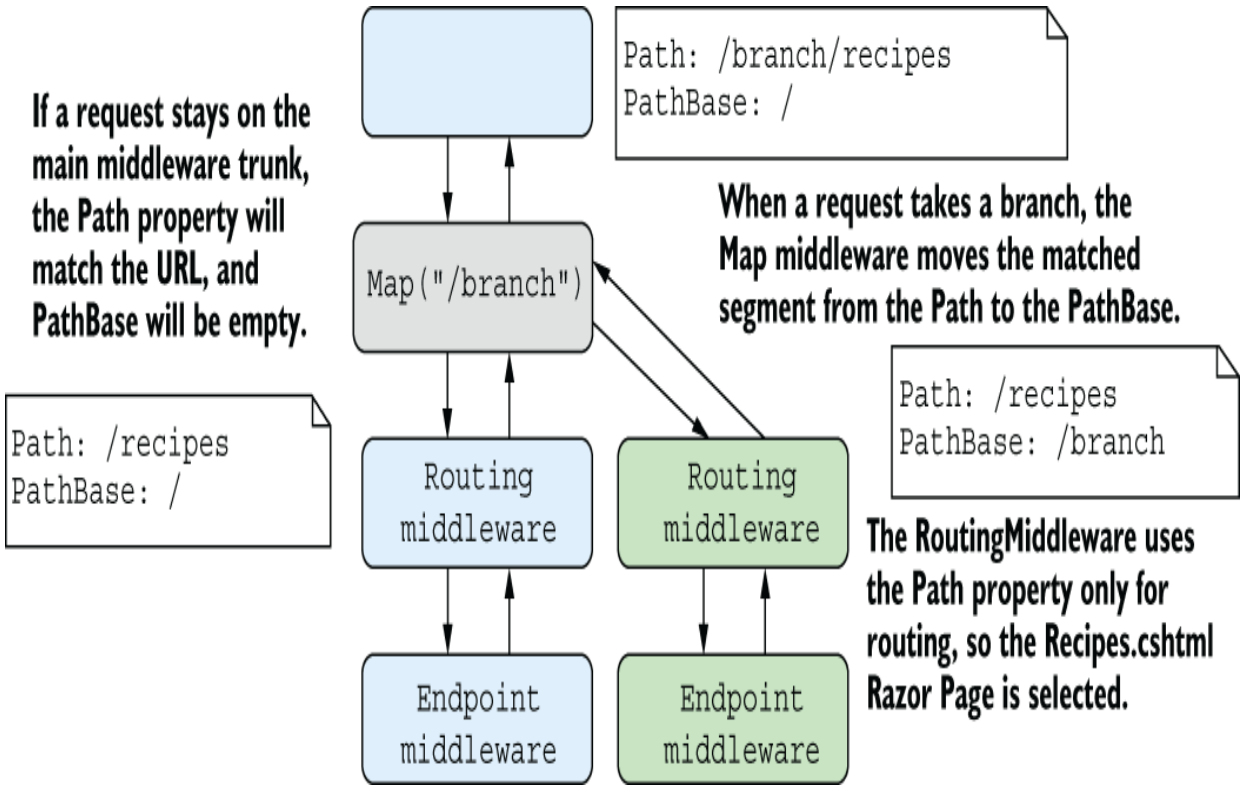

Figure 31.2 When the `Map` extension diverts a request to a branch, it removes the matched segment from the `Path` property and adds it to the `PathBase` property.

NOTE ASP.NET Core's link generator (used in Razor and minimal APIs, as discussed in chapter 6) uses `PathBase` to ensure that it generates URLs that include the `PathBase` as a prefix.

You've seen the `Run` extension, which always returns a response, and the `Map` extension, which creates a branch in the pipeline. The next extension we'll look at is the general-purpose `Use` extension.

31.1.3 Adding to the pipeline with the Use extension
