Listing 31.6 Creating an extension method to expose `HeadersMiddleware`

```
public static class MiddlewareExtensions
{
    public static IApplicationBuilder UseSecurityHeaders( ❶
        this IApplicationBuilder app)                     ❶
    {
        return app.UseMiddleware<HeadersMiddleware>();    ❷
    }
}
```

❶ By convention, the extension method should return an IApplicationBuilder to allow chaining.

❷ Adds the middleware to the pipeline

With this extension method, you can now add the headers middleware to your app using

```
app.UseSecurityHeaders();
```

TIP My SecurityHeaders NuGet package makes it easy to add security headers using middleware without having to write your own. The package provides a fluent interface for adding the recommended security headers to your app. You can find instructions on how to install it at http://mng.bz/JggK.

Listing 31.5 is a simple example, but you can create middleware for many purposes. In some cases you may need to use DI to inject services and use them to handle a request. You can inject singleton services into the constructor of your middleware component, or you can inject services with any lifetime into the `Invoke` method of your middleware, as demonstrated in the following listing.

Listing 31.7 Using DI in middleware components

```
public class ExampleMiddleware
{
    private readonly RequestDelegate _next;
```
