1. Install the Lamar.Microsoft.DependencyInjection NuGet package using the NuGet package manager, by running `dotnet add package`

```
dotnet add package Lamar.Microsoft.DependencyInjection
```

   or by adding a `<PackageReference>` to your .csproj file:

```
<PackageReference
    Include="Lamar.Microsoft.DependencyInjection" Version="8.1.0" />
```

2. Call `UseLamar()` on `WebApplicationBuilder.Host` in Program.cs:

```
WebApplicationBuilder builder = WebApplication.CreateBuilder(args);
builder.Host.UseLamar(services => {})
WebApplication app = builder.Build();
```

3. Configure the Lamar `ServiceRegistry` in the lambda method passed to `UseLamar()`, as shown in the following listing. This is a basic configuration, but you can see a more complex example in the source code for this chapter.

Listing 31.16 Configuring `Lamar` as a third-party DI container

```
builder.Host.UseLamar(services =>                          ❶
{
    services.AddAuthorization();                           ❷
    services.AddControllers()                              ❷
        .AddControllersAsServices();                       ❸

    services.Scan(_ => {                                   ❹
        _.AssemblyContainingType(typeof(Program));         ❹
        _.WithDefaultConventions();                        ❹
    });                                                    ❹
}
```
