32.1.2 Creating a custom Tag Helper to conditionally hide elements

If you want to control whether an element is displayed in a Razor template based on some C# variable, you'd typically wrap the element in a C# `if` statement:

```
@{
    var showContent = true;
}
@if(showContent)
{
    <p>The content to show</p>
}
```

Falling back to C# constructs like this can be useful, as it allows you to generate any markup you like. Unfortunately, it can be mentally disruptive having to switch back and forth between C# and HTML, and it makes it harder to use HTML editors that don't understand Razor syntax.

In this section you'll create a simple Tag Helper to avoid the cognitive dissonance problem. You can apply this Tag Helper to existing elements to achieve the same result as shown previously but without having to fall back to C#:

```
@{
    var showContent = true;
}
<p if="showContent" >
    The content to show
</p>
```

When rendered at runtime, this Razor template would return the HTML

```
<p>
    The content to show
```
